

Object Oriented Programming

David E. Culler
CS8 – Computational Structures in Data Science
<http://inst.eecs.berkeley.edu/~cs88>

Lecture 9
October 22, 2018

Today's notebooks: <http://bit.ly/cs88-fa18-L09>

Computational Concepts Toolbox

- Data type: values, literals, operations,
- Expressions, Call expression
- Variables
- Assignment Statement
- Sequences: tuple, list
- Dictionaries
- Data structures
- Tuple assignment
- Function Definition Statement
- Conditional Statement
- Iteration: list comp, for, while
- Lambda function expr.
- Higher Order Functions
 - Functions as Values
 - Functions with functions as argument
 - Assignment of function values
- Higher order function patterns
 - Map, Filter, Reduce
- Function factories – create and return functions
- Recursion
 - Linear, Tail, Tree
- Abstract Data Types
- Mutation

10/22/18 UCB CS88 Sp18 L09 2

Today: Resolution

Elegance and beauty of Functional Pgm Power of mutation of state

Structured Object Oriented Programming

10/22/18 UCB CS88 Sp18 L09 3

Today: class

- Language support for object oriented programming
- Defining a class introduces a new type of object
 - class is the type
- It has attributes
- It has methods
- These implement its behaviors

10/22/18 UCB CS88 Sp18 L09 4

Review: Objects

- Objects represent information
- Consist of data and behavior, bundled together to create abstractions
 - Abstract Data Types
- They can have state
 - mutable vs immutable
- Object-oriented programming
 - A methodology for organizing large programs
 - So important it is supported in the language (classes)
- In Python, every value is an object
 - All **objects** have **attributes**
 - Manipulation happens through **methods**
- Functions do one thing (well)
 - Object do a collection of related things

10/22/18 UCB CS88 Sp18 L09 5

Administrative Issues

- Maps due 10/24

10/22/18 UCB CS88 Sp18 L09 6

Review: Bank account using dict

```
account_number_seed = 1000
def account(name, initial_deposit):
    global account_number_seed
    account_number_seed += 1
    return {'Name': name, 'Number': account_number_seed,
            'Balance': initial_deposit}

def account_name(acct):
    return acct['Name']

def account_balance(acct):
    return acct['Balance']

def account_number(acct):
    return acct['Number']

def deposit(acct, amount):
    acct['Balance'] += amount
    return acct['Balance']

def withdraw(acct, amount):
    acct['Balance'] -= amount
    return acct['Balance']
```

10/22/18

UCB CS88 Sp18 L09

7

Python class statement

```
class <ClassName>:
    def <method-1>(self, ...):
        self.<instance_attr> = ...
    .
    .
    .
    def <method-N>
```

<https://docs.python.org/3/tutorial/classes.html>

Class names should normally use the **CapWords** convention.

<https://www.python.org/dev/peps/pep-0008/>

10/22/18

UCB CS88 Sp18 L09

8

Example: Account

```
class Account:
    # Constructor
    def __init__(self, name, initial_deposit):
        # Initialize the instance attributes
        self.name = name
        self.balance = initial_deposit

    # Selectors
    def account_name(self):
        return self.name

    def account_balance(self):
        return self.balance

    # Operations
    def deposit(self, amount):
        self.balance += amount
        return self.balance
```

10/22/18

UCB CS88 Sp18 L09

9

Creating an object, invoking a method

```
my_acct = Account()
my_acct.init("David Culler", 93)
my_acct.withdraw(42)
```

10/22/18

UCB CS88 Sp18 L09

10

Special Initialization Method

```
class Account:
    # Constructor
    def __init__(self, name, initial_deposit):
        # Initialize the instance attributes
        self.name = name
        self.balance = initial_deposit
        # Return None

    # Selectors
    ...

    def withdraw(self, amount):
        self.balance -= amount
        return self.balance

    # Display representation
    def __repr__(self):
        return '<Acct: ' + str(self.account_name()) + '>'
```

10/22/18

UCB CS88 Sp18 L09

11

Attributes and “private”

- Attributes of an object accessible with ‘dot’ notation
obj.attr
- Alternative to selector/mutator methods
- Most OO languages provide private instance fields
 - Python leaves it to convention, use `__`

10/22/18

UCB CS88 Sp18 L09

12

Example

```
class Account:  
    # Constructor  
    def __init__(self, name, initial_deposit):  
        # Initialize the instance attributes  
        self._name = name  
        self._balance = initial_deposit  
        # Return None  
  
    # Selectors  
    def account_name(self):  
        return self._name  
  
    def account_balance(self):  
        return self._balance  
  
    # Operations  
    def deposit(self, amount):  
        self._balance += amount  
        return self._balance
```

10/22/18

UCB CS88 Sp18 L09

13

Class attributes

- Pertain to the class as a whole
- Not to individual objects
- Name relative to class, not self

10/22/18

UCB CS88 Sp18 L09

14

Example: class attribute

```
class Account:  
    # Class attributes outside and class defs  
    _account_number_seed = 1000  
  
    # Constructor  
    def __init__(self, name, initial_deposit):  
        # Initialize the instance attributes  
        self._name = name  
        self._acct_no = Account._account_number_seed  
        Account._account_number_seed += 1  
        self._balance = initial_deposit  
        # Return None  
  
    # Selectors  
    def account_name(self):  
        return self._name  
    ...  
    def account_number(self):  
        return self._acct_no
```

10/22/18

UCB CS88 Sp18 L09

15

Inheritance

- Define a class as a specialization of an existing class
- Inherit its attributes, methods (behaviors)
- Add additional ones
- Redefine (specialize) existing ones
 - Ones in superclass still accessible in its namespace

```
class ClassName (<inherits>):  
    <statement-1>  
    .  
    .  
    .  
    <statement-N>
```

10/22/18

UCB CS88 Sp18 L09

16

Example

```
class CheckingAccount(Account):  
  
    def __init__(self, name, initial_deposit):  
        # Use superclass initializer  
        Account.__init__(self, name, initial_deposit)  
        # Additional initialization  
        self._type = "Checking"  
        Attribute in subclass, not in superclass  
  
    def account_type(self):  
        return self._type  
  
    # Display representation  
    def __repr__(self):  
        return '<' + str(self.account_type()) + 'Account:>...'
```

10/22/18

UCB CS88 Sp18 L09

17

Another Example

```
class SavingsAccount(Account):  
  
    interest_rate = 0.02  
  
    def __init__(self, name, initial_deposit):  
        # Use superclass initializer  
        Account.__init__(self, name, initial_deposit)  
        # Additional initialization  
        self._type = "Savings"  
        Methods in subclass, not in superclass  
  
    def account_type(self):  
        return self._type  
  
    def accrue_interest(self):  
        self._balance = self._balance *  
            (1 + SavingsAccount.interest_rate)
```

10/22/18

UCB CS88 Sp18 L09

18

Classes using classes

```
class Bank:  
    _accounts = []  
  
    def add_account(self, name, account_type, initial_deposit):  
        if account_type == 'Savings':  
            new_account = SavingsAccount(name, initial_deposit)  
        elif account_type == 'Checking':  
            new_account = CheckingAccount(name, initial_deposit)  
        else:  
            assert True, "Bad Account type: " + account_type  
        assert initial_deposit > 0, "Bad deposit"  
  
        Bank._accounts.append(new_account)  
        return new_account  
  
    def accounts(self):  
        return self._accounts[:]  
  
    def show_accounts(self):  
        for acct in self.accounts():  
            print(acct.account_number(), acct.account_type(),  
                  acct.account_name(), acct.account_balance())
```

10/22/18

UCB CS88 Sp18 L09

P

Key concepts to take forward

- Classes embody and allow enforcement of ADT methodology
- Class definition
- Class namespace
- Methods
- Instance attributes (fields)
- Class attributes
- Inheritance
- Superclass reference

10/22/18

UCB CS88 Sp18 L09

20

Additional examples

- Redesign our KV as a class
- How should “new KV” vs mutation be handled
- Inheritance and “new object” in superclass

10/22/18

UCB CS88 Sp18 L09

21

Computational Concepts Toolbox

- Data type: values, literals, operations,
- Expressions, Call expression
- Variables
- Assignment Statement
- Sequences: tuple, list
- Dictionaries
- Data structures
- Tuple assignment
- Function Definition Statement
- Conditional Statement
- Iteration: list comp, for, while
- Lambda function expr.
- Higher Order Functions
 - Functions as Values
 - Functions with functions as argument
 - Assignment of function values
- Higher order function patterns
 - Map, Filter, Reduce
- Function factories – create and return functions
- Recursion
 - Linear, Tail, Tree
- Abstract Data Types
- Mutation
- Class
 - Object Oriented Programming
