Maps: Due 3/16

Debugging is important!

print('DEBUG:', x)

python3 0k -q 09 -i #interactive mode

https://go.c88c.org/here

Passcode: recursion

Learning Objectives

- Write a recursive function
- Understand the base case and a recursive case
- Apply Recursive Functions to lists

The Recursive Process

- Recursive solutions involve two major parts:
 - Base case(s), the problem is simple enough to be solved directly
 - Recursive case(s). A recursive case has three components:
 - Divide the problem into one or more simpler or smaller parts
 - Invoke the function (recursively) on each part, and
 - Combine the solutions of the parts into a solution for the problem.

```
For loop:
```

```
def sum(n):
    s=0
    for i in range(0,n+1):
        s=s+i
    return s
```

```
While loop:
```

```
def sum(n):
    s=0
    i=0
    while i<n:
        i=i+1
        s=s+i
    return s</pre>
```

UC Berkeley | Computer Science 88 | Michael Ball | http://cs88.org

```
Recursion:
```

```
def sum(n):
    if n == 0:
        return 0
    return n+sum(n-1)
```

Iteration vs Recursion: Cheating!

Sometimes it's best to just use a formula! But that's not always the point. ©

```
def sum(n):
return (n * (n + 1)) / 2
```

In words

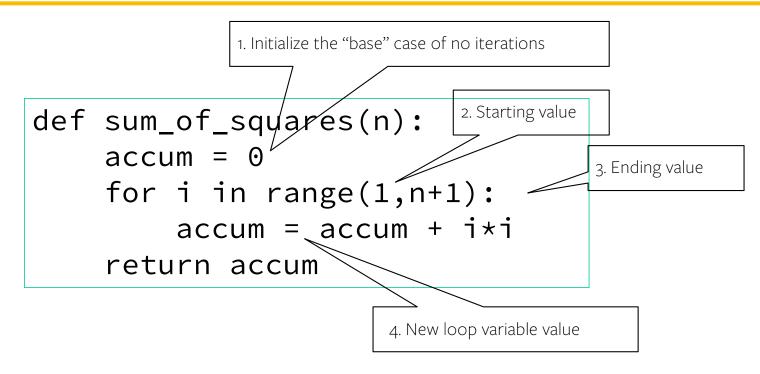

- The sum of no numbers is zero
- The sum of 12 through n2 is the
 - sum of 1^2 through $(n-1)^2$
 - plus n²

```
def sum_of_squares(n):
    if n < 1:
        return 0
    else:
        return sum_of_squares(n-1) + n**2</pre>
```

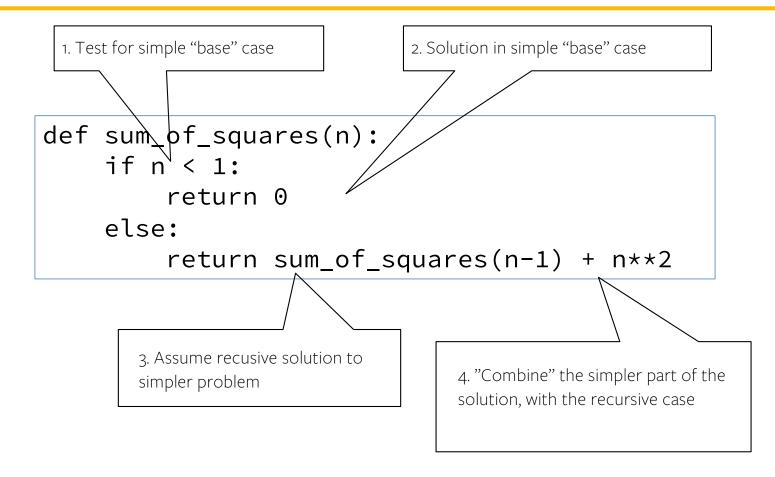

Recall: Iteration

Recursion Key concepts – by example

In words

- The sum of no numbers is zero
- The sum of 12 through n2 is the

```
sum of 1² through (n-1)²
plus n²
```

```
def sum_of_squares(n):
    if n < 1:
        return 0
    else:
        return sum_of_squares(n-1) + n**2</pre>
```

```
sum_of_squares(3)

# sum_of_squares(3) => sum_of_squares(2) + 3**2

# => sum_of_squares(1) + 2**2 + 3**2

# => sum_of_squares(0) + 1**2 + 2**2 + 3**2

# => 0 + 1**2 + 2**2 + 3**2 = 14
```

- In what order do we sum the squares?
- How does this compare to iterative approach?

```
def sum_of_squares(n):
    accum = 0
    for i in range(1,n+1):
        accum = accum + i*i
    return accum
```

```
def sum_of_squares(n):
    if n < 1:
        return 0
    else:
        return sum_of_squares(n-1) + n**2</pre>
def sum_of_squares(n):
    if n < 1:
        return 0
    else:
    return n**2 + sum_of_squares(n-1)</pre>
```

Local variables

- Each call has its own "frame" of local variables
- Let's see the environment diagrams

```
def sum_of_squares(n):
    n_squared = n**2
    if n < 1:
        return 0
    else:
        return n_squared + sum_of_squares(n-1)</pre>
```

https://goo.gl/CiFaUJ

How does it work?

- Each recursive call gets its own local variables
 - Just like any other function call
- Computes its result (possibly using additional calls)
 - Just like any other function call
- Returns its result and returns control to its caller
 - Just like any other function call
- The function that is called happens to be itself
 - Called on a simpler problem
 - Eventually stops on the simple base case

Passcode: recursion

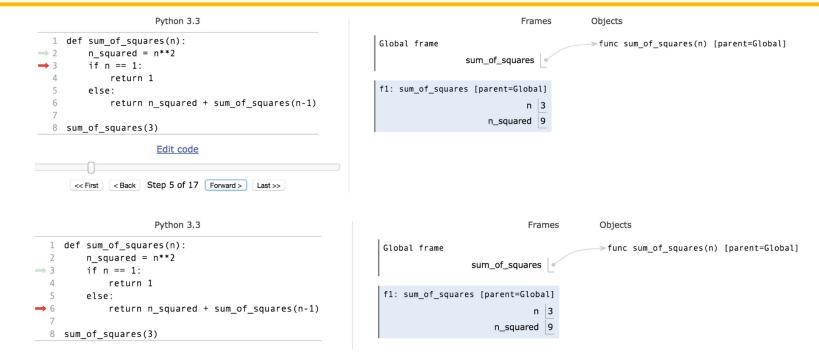

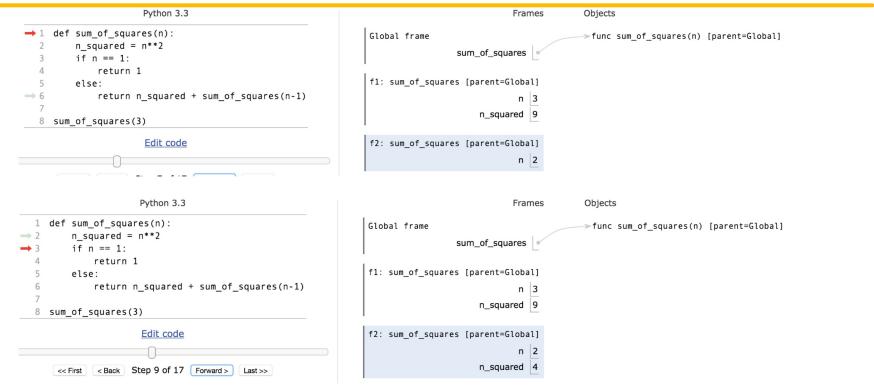

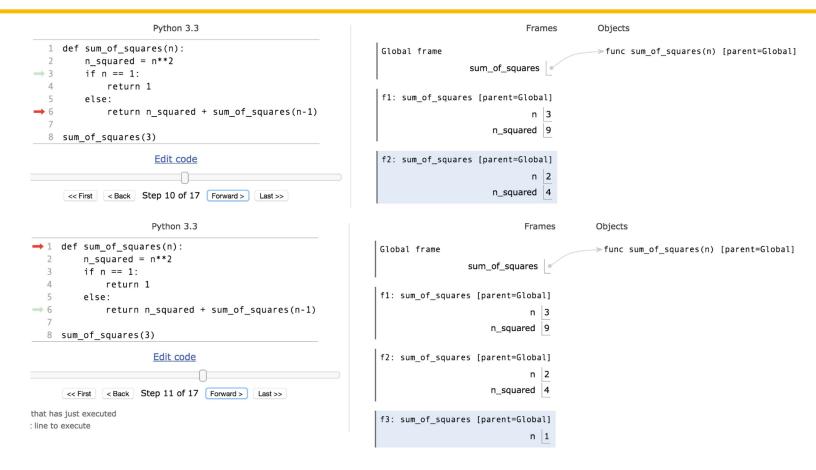

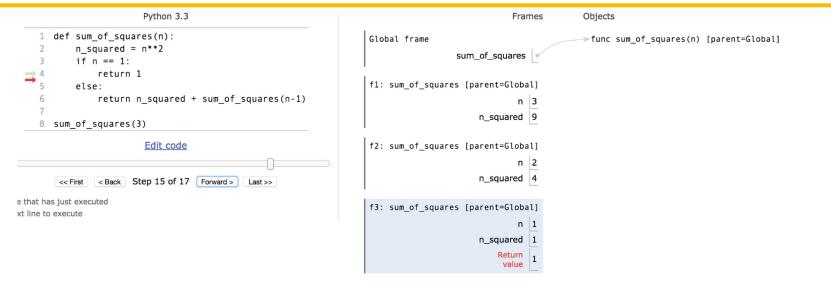

```
Python 3.3
    1 def sum_of_squares(n):
           n_{squared} = n**2
           if n == 1:
               return 1
           else:
               return n_squared + sum_of_squares(n-1)
   8 sum_of_squares(3)
                         Edit code
       << First | < Back | Step 13 of 17 | Forward > Last >>
that has just executed
t line to execute
                         Python 3.3
   1 def sum_of_squares(n):
           n = n**2
           if n == 1:
               return 1
           else:
               return n_squared + sum_of_squares(n-1)
   8 sum_of_squares(3)
                         Edit code
       << First | < Back | Step 14 of 17 | Forward > | Last >>
that has just executed
t line to execute
```

```
Frames
                                          Objects
Global frame
                                          > func sum_of_squares(n) [parent=Global]
                 sum_of_squares
f1: sum_of_squares [parent=Global]
                     n_squared 9
f2: sum_of_squares [parent=Global]
                             n 2
                     n_squared 4
f3: sum_of_squares [parent=Global]
                             n 1
                     n_squared 1
                                          Objects
                            Frames
Global frame
                                          >func sum_of_squares(n) [parent=Global]
                 sum_of_squares
f1: sum of squares [parent=Global]
                             n 3
                     n_squared 9
f2: sum_of_squares [parent=Global]
                     n_squared 4
f3: sum_of_squares [parent=Global]
                             n 1
                     n_squared 1
```

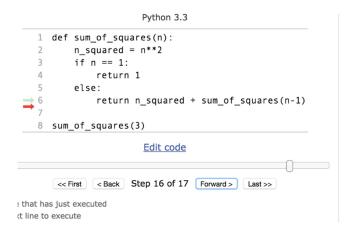

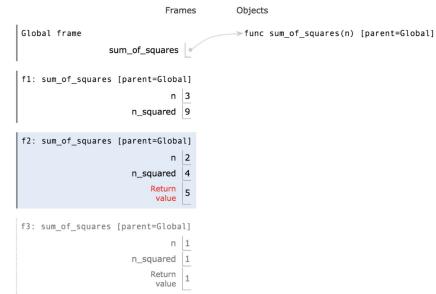

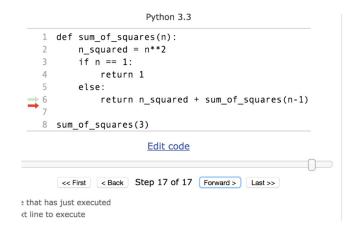

Recursion Visualizer

- A new tool, similar to PythonTutor which shows just the recursive calls.
- View Recursion

Recursion With Lists

- Goal: Find the smallest item in a list, recursively.
- Consider: How do we break this task into smaller parts? What is the "smallest list"?
 - We care about the size of the list itself, not the values.

UC Berkeley | Computer Science 88 | Michael Ball | http://cs88.org

min_r

- Works because we can eventually call min() with just two numbers
- Each recursive call shrinks the list by 1 element.
- Python Tutor Link (with first and rest functions)
- Python Tutor (no first/rest defined)
 - This is just shorter and reduces the number of frames, but the same recursive calls
- Sadly recursionvisualizer.com doesn't work on this example 🕾

Recursion With Strings, and Other Iterables

- Consider the lists example. It's basically the same thing. ©
- Recursive case: Split up the item into a small "first" item, and the "rest"

```
def reverse(s):
    """
    >>> reverse('hello')
    'olleh'
    >>> reverse(reverse('hello'))
    'hello'
    """
    if not s:
        return ''
    return reverse(rest(s)) + first(s)
    # return reverse(s[1:]) + s[0]
```

UC Berkeley | Computer Science 88 | Michael Ball | http://cs88.org

Why Recursion?

- After Abstraction, Recursion is probably the 2nd biggest idea in this course
- It's tremendously useful when the problem is self-similar
- It's no more powerful than iteration, but often leads to more concise & better code
- "It's more 'mathematical"
- "It embodies the beauty and joy of computing"
